SUBJECT: NEW AMBULATORY INFUSION PUMP INTRODUCES NEW FEATURES
FOR IMMEDIATE RELEASE

Denver, Colorado, August 17th, 2007 – The newly released WalkMed[®] 350VL Ambulatory Infusion Pump delivers on features requested by oncologists utilizing the portable, battery operated pump. Building on the legendary reliability of the WalkMed 350 Ambulatory Infusion Pump, the WalkMed 350VL offers keypad lock-out, an increased infusion rate capability, a total infused volume limit, tracking and display of current infused volume, and more.

The WalkMed 350VL Ambulatory Infusion Pump provides adjustable basal rates, the choice to input a total volume to be delivered, and the choice to lock the system programming. Once the pump is started, it provides system status and delivered volume at a glance. The robust design allows for the patient to replace the battery if necessary while in lock-out mode and without loss of delivered volume information or system programming. It can be used with 65 mL, 150 mL and 250 mL reservoir bags and infusion sets available from WalkMed Infusion. Its small size, ease of use, and system alerts ensure patient safety and convenience during use.

The WalkMed product line, consisting of specially designed pumps for oncology therapy delivery, patient controlled analgesia, epidural pain management, and continuous with pre-defined intermittent bolus delivery, is based upon a design that allows highly accurate and reliable delivery.

WalkMed Infusion LLC, a newly formed company, acquired the WalkMed line of products from McKinley Medical LLC in May 2007 and has been providing products and services in support of existing customers and new customers alike. WalkMed Infusion is located in suburban Denver, CO., with a focus on ambulatory infusion products meeting a wide variety of patient and clinician needs.
